

REC-43

Auxiliary Receiver/Channel Expander

The REC-43 is an auxiliary receiver for adding channels to any of Omega's keyless entry/security systems. It is also useful for garage door and home appliance applications (external 12 volt supply required). It features 4 channels that are independently configurable for latching output, timed output (.5-120 seconds), or output for as long as you hold the transmitter button. It is compatible with most of Omega's remote transmitters. The REC-43's compact design allows for discreet installation and its shell can be clipped to most Omega alarms. Harnesses are included.

REMOTE START ACCESSORIES

RS-RP

Remote Start Expansion Pack

This module allows you to add extra ignition or starter outputs to remote start systems. It provides 1 additional ignition output and 1 additional starter output. It can be configured for 2 ignition outputs or 2 starter outputs. This module is plug-n-play compatible with all Omega remote start systems.

RS-OUTPUT

Remote Start Expansion Harness

This is a universal harness for configuring your own extra ignition circuits or for interfacing to a variety of remote starting accessories. It provides a negative ignition output, a negative starter output, and a constant 12 volt output for driving relay coils. The harness is 12" in length and plugs directly into all Omega remote car starters.

AU-TI-C

Transponder Detection Tool

This cool little gizmo allows you to detect the presence of a transponder based immobilizer by transmitting a jamming signal when powered. Simply plug the AU-TI-C into the vehicle's cigarette lighter and try to start the car. If it starts, there is no transponder present.

AU-TI-L

Transponder Detection Tool

This is the same as the AU-TI-C but it adds a power indicator light to indicate whether or not the tool stays powered while cranking the car. It's just further insurance that you won't get false test results.
